

Unify Product and Project Data

Omnify Software provides a single, secure location to manage the complete product record including: product data, bill of materials, engineering changes, documentation, project, quality/CAPA, and training records information. The system enhances visibility into the entire product development process by capturing design, manufacturing, quality, service, and customer information and associating it to the product record.

Unify Product and Project Data

The Omnify Empower PLM system offers a Project Management module to enable organizations to track and capture all product *and* project data in a single environment. The Project Management module allows you to automate the management of tasks, project schedules, resources, and deliverables for a more accurate view of project progress and completion. Associating project information with product records allows deadlines and tasks to be visible to all groups involved in product development. By providing an analysis and trend recognition facility, Project Management also helps to correct and improve product development cycles.

The Project Management module is integrated with all product data stored in Omnify to centralize product and project data. The Omnify Project Management module provides a facility to:

- Capture and track critical project data
- Integrate and associate project and product data
- Automate task status and progress
- Report and analyze projects (trend analysis, resource allocation, schedule predictions)
- Export to Microsoft Project for enhanced reporting

Automated Tasks

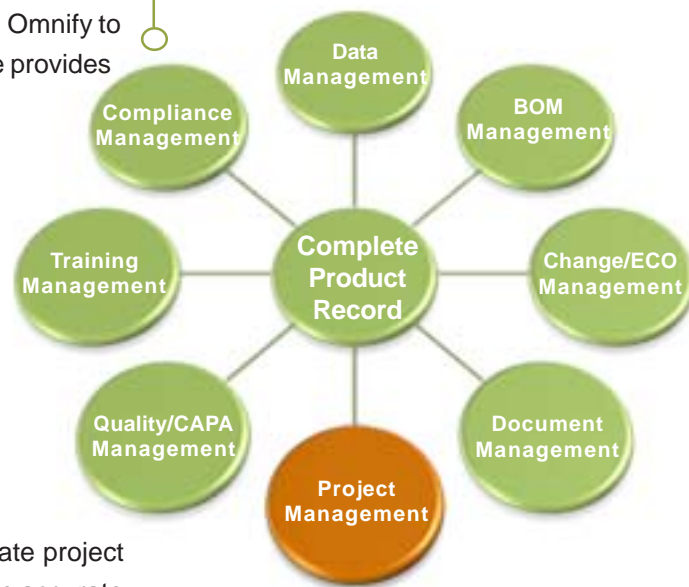

Automated Tasks enable external and system actions to automatically update project progress, eliminating the vagueness of manual processes and ensuring more accurate prediction of product delivery.

Easily Identify Bottlenecks

Custom views and reporting allow organizations to quickly analyze key project data. This enables easy identification of common issues/bottlenecks that impact deadline-sensitive activities resulting in more efficient resource allocation and improved development cycles.

Key Benefits:

- Unified location to manage all product and project data
- Eliminate manual project management processes
- Enhance visibility of progress across all teams
- Link projects directly to product record
- Ensure accurate prediction of product delivery
- Improve resource allocation
- Easily identify trends/bottlenecks
- Improve development cycles
